      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention describes a novel antifreeze protein (AFP) obtained from Lichen that comprises an apparent mol. wt. of 20-28kD and has an N-terminal amino acid sequence which shows at least 80% overlap with sequence shown in AAY27010; and and modified versions and isoforms of this protein. The AFP can conveniently be used in food products, preferably in food products which are frozen or intended to be frozen. Especially preferred is the use of AFPs in products which are heated e. by pasteurisation or sterilisation prior to freezing and in frozen confectionery products. Using the AFP ingredient, mixes can be frozen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a novel antifreeze protein (AFP) obtained from Lichen that comprises an apparent mol. wt. of 20-28kD and has an N-terminal amino acid sequence which shows at least 80% overlap with the present sequence; and and modified versions and isoforms of this protein. The AFP can conveniently be used in food products, preferably in food products which are frozen or intended to be frozen. Especially preferred is the use of AFPS in products which are heated e.g. by pasteurisation or sterilisation prior to freezing and in frozen confectionery products. Using the AFP ingredient, mixes can be frozen under quiescent conditions, e.g. in a shop or home freezer without the formation of unacceptable ice crystal shapes and hence with a texture different to products normally obtained via quiescent freezing. The present sequence represents a N-terminal fragment of an AFP.

                                                                                                                                                                                                                                                                         The invention provides novel secreted human proteins (SECX) and nucleotide sequences encoding the SECX polypeptides. The SECX polypeptides can be expressed by standard recombinant methodology. SECX polypeptides are useful for the treatment, prevention or delay of onset polypeptides are useful for the treatment, prevention or delay of onset of the pathological condition associated with aberrant SECX expression or of the pathological condition associated with aberrant SECX expression or

Various SECX nucleic acids were cloned into insect cells and human embryonic kidney 293 cells and quantitative expression of the clones was analysed. By detecting the presence of a SECX nucleic acid or polypeptide in a sample it is possible to diagnose a pathological condition, especially cancer, associated with aberrant SECX expression or condition, especially cancer, associated with aberrant SECX expression or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides novel secreted human proteins (SECX) and nucleotide sequences encoding the SECX polypeptides. The SECX polypeptides can be expressed by standard recombinant methodology. SEC polypeptides are useful for the treatment, prevention or delay of onse of a pathological condition associated with aberrant SECX expression cactivity, i.e. cancer. The present sequence represents the amino acid of a human SECX polypeptide (see DE line for clone identification).

                                                                                                                                                                                                                                                                  This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV34145) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 70 novel genes and their fragments (nucleic acid sequences: AAV34154-V34276; amino acid sequences AAW75057-W75179) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in the described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in the following the amount of the second mutations in the presence of mutations in the new polynucleotides. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in the following the presence of mutations in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Feng P,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC AAY13344-403 represent secreted and transmembrane human proteins.
CC The cDNA sequences are obtained from cDNA libraries, prepared from CC fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.
CC The encoded polypeptides have specific uses based on their homology to CC known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and maintenance of gastrointestinal CC (e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal CC (e.g. enterocolitis, Ellison syndrome of the vulva and gliomas), CC (e.g. enterocolitis, Ellison syndrome of the vulva and gliomas), CC (e.g. enterocolitis, Ellison syndrome of the vulva and gliomas), CC (e.g. enterocolitis, Ellison syndrome, ecalls including parkinson's disease, ALS, neuropathies or cancer. PRO265 can be used as a continuous syndrome or Atrophia areata; PRO333 may be used in the treatment CC (e.g. enti-thrombotic agent; PRO287 polypeptides and portions may have continuous explications in wound healing and tissue repair, PRO317 can be used for treating problems of the kidney, uterus, endometrium, blood continuous explications in wound healing and tissue repair, PRO317 can be used so in the treatment continuous explications in wound healing and tissue repair, PRO317 can be used for treating problems of the kidney, uterus, endometrium, blood continuous explications in wound healing and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

```
Conditions such as asthma, and in immune suppression after organ

Ctransplantation. The protein is useful in regulation of haematopoiesis

C and consequently in the treatment of myeloid or lymphoid cell

C deficiencies. It is also used in compositions for tissue growth or

CC regeneration. The protein is also used in the treatment of osteoporosis

CC or osteoarthritis and in the treatment of periodontal disease and other

CC tooth repair processes. The protein is used in the treatment of nervous

CC system disorders such as Alzheimer's disease, parkinson's disease, and

Huntington's disease. They are useful for protection or regeneration and

Ctreatment of lung or liver fibrosis, reperfusion injury in various

Ctissues, and conditions resulting from systemic cytokine damage. They are

also used for promoting or inhibiting tissue differentiation. They are

calso used as contraceptives since they exhibit activin or inhibin related

activities and as a fertility inducing therapeutic. They are used for

C conditions resulting from coagulation activities e.g. myocardial

They are used for promoting or also acts as recenter leader.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immune stimulating or immune suppressing activity. It can be used in the treatment of various immune deficiencies and disorders, and to treat infectious diseases caused by viral, bacterial, fungal or other infections. The protein is also used for treating autoimmune disorders such as multiple sclerosis, systemic lupus erythematosus, and rheumatoid arthritis. It is also useful in the treatment of allergic reactions and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24-JUL-1998;

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the expression in the test sample indicates the presence of a tumour in the mammal Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNP) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to nucleic acid sequences AAF93744 - AAF93916 which encode human secretory or membrane proteins represented by AAB88317 - AAB88419. Included in the invention are primers AAF93917 - AAF94295 and AAF62232 - AAF62235 which are used to isolate the CDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polynucleotide sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB80246;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB80246 standard; Protein; 467
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid arthritic and disheters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             can be used in gene therapy. The polynucleotide sequences and the proteins they encode may be used in the prevention, treatment and diagnosts of diseases associated with inappropriate secretory protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays

The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis) cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. genterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, parkinson's disease), wound repair, cardiovascular disorders (e.g. parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatorid arthritis, multiple sclerosis), infertility, AIDS and diabetes and retinal disorders such as retinitis pigmentosum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sixty one nucleic acids encoding PRO polypeptides which are useful in the treatment of skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma) and neurodegenerative diseases (e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                              This protein comprises Rhodosporidium toruloides ATCC 10657 cephalosporium esterase, an enzyme that catalyses the hydrolysis of the 3' acetyl groups of cephalosporins. The enzyme, especially the mature polypeptide, can be purified from cultures of R. toruloides or expressed in claimed host cells (preferably Escherichia coli, R. toruloides, Cephalosporium acremonium or Penicillium chrysogenum) transformed with a vector comprising cephalosporin esterase cDNA or genomic DNA (see ANV21460-61). The isolated polypeptides, even if catalytically inactive, can also be used for the production of antibodies for use in detection and purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated cephalosporin esterase gene - obtained from Rhodosporidium toruloides, used to obtain products which can be used for hydrolysis of cephalosporins

Title: Perfect score: Sequence: US-09-582-296-2 101

1 APAVVMGDAESFGAIAHGGL 20

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 105224 segs, 38719550 residues

Total number of hits satisfying chosen parameters: 105224

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: Integral membrane protein.
ALTERNATIVE PRODUCTS: 2 isoforms; 1/A and 2/B (shown here);
produced by alternative splicing.
SIMILARITY: BELONGS TO THE MIP/AQUAPORIN FAMILY (TC 1.A.8).
